

Sprint 2 — Stabilization & Growth

Enhance core features, migrate data catalogs, and implement AI capabilities

Goal: Build on Sprint 1 by stabilizing the platform, migrating Excel-based food and workout catalogs, implementing offline support, and adding intelligent food image recognition to accelerate meal logging.

1. Stabilization & Fixes

Apply fixes and refinements identified during Sprint 1 based on testing and user feedback. This includes performance optimization, UI/UX improvements, and bug fixes.

Acceptance criteria

- All high-priority bugs from Sprint 1 are resolved.
- UI performance is smooth across target mobile devices.
- User feedback from Sprint 1 review is incorporated into design iterations.

2. Data Migration: Food & Workout Catalogs

2.1 Food Catalog

Feature	Description	Priority
Import food data	Migrate food items, macros, and categories from Excel into the database.	P0
Search & filter foods	Coach can quickly find and assign foods to meal plans.	P0

Acceptance criteria

- All food items from the Excel catalog are imported with names, macros, and categories.
- Coach can search by name, category, or macros.
- Food items are editable and new items can be added in the app.

2.2 Workout Catalog

Feature	Description	Priority
Import workout data	Migrate exercises and programs from Excel into the database.	P0
Search & filter workouts	Coach can quickly find and assign exercises to training plans.	P0

Acceptance criteria

- All exercises from the Excel catalog are imported with names, descriptions, and categories.
- Coach can search by name, category, or muscle group.
- Exercises are editable and new exercises can be added in the app.

3. Mobile Enhancement: Food Image Recognition

3.1 Image Capture & Recognition

Feature	Description	Priority
Capture meal photo	Client can photograph a meal within the app.	P0
Identify food items	AI analyzes the photo to detect food items and estimate macros.	P0
Confirm & adjust	Client reviews AI results and can manually adjust portions/macros if needed.	P1

Acceptance criteria

Camera integration works on both iOS and Android.
Image is sent to AI service for analysis (e.g., vision API).
AI returns detected food items with calorie/macro estimates.
Client can confirm and save the meal, or edit detected items and portions.
Meal is recorded with detected macros and a reference to the photo.

4. Offline Support

4.1 Offline-First Architecture

Feature	Description	Priority
Offline data sync	Clients can record meals and training sessions offline; data syncs when online.	P0

Acceptance criteria

Clients can submit meals, training, and progress forms even without internet.
Local changes are queued and synced automatically when connectivity is restored.
Conflict resolution is handled gracefully (e.g., coach edits during offline period).
User is informed of sync status and any unresolved conflicts.

5. Coach Features: Enhanced Review & Notifications

5.1 Advanced Progress Analytics

Feature	Description	Priority
Coach notifications	Coach receives alerts for important client events (missed sessions, significant progress changes).	P1
Client notifications	Client receives reminders for upcoming meals/training and feedback from coach.	P1

Acceptance criteria

Coach can configure notification preferences (email, push).
Notifications include actionable context (client name, what triggered it).
Client can opt in/out of notification types.

6. Technical & Operational Considerations

Area	Considerations
Data Migration	Plan backward compatibility; test sync between old (seed) and new (Excel) data models.
Image Recognition Integration	Evaluate vision APIs (Google Vision, Azure Computer Vision, or similar). Handle rate limits and costs.
Offline Sync	Use local storage (SQLite, Realm, or similar) and implement conflict resolution strategy.
Notifications	Implement push notification service; coordinate with backend for event triggers.
Security & Compliance	Ensure offline data is encrypted at rest; validate image privacy and retention policies.
